Candling, take-out and transfer system

Benefits

Easy and flexible in operation, this unit candles and transfers up to 50,000 eggs per hour, depending on which version is selected. When equipped with the mobility package, the whole system can easily be positioned wherever it is needed in the hatchery, with an inline candling light system for continuous operation and a data registration interface, to provide information that helps to optimise process control. A semi-automatic transfer unit can easily be replaced by a fully automatic option, to reduce the number of operators required.

How it works

- The light sensor in the candling unit scans each tray, revealing whether eggs are fertile or clear by the amount of light passing through each egg. This information can be recorded into the hatchery's database for review, reference and reporting
- Infertile (clear) eggs are automatically removed from the setter tray and discharged for further handling. The proportion of fertile to infertile eggs has no effect on machine capacity
- Remaining fertile eggs are then picked up from the setter tray by the vacuum transfer unit, to be placed gently into hatcher baskets either automatically or semi-automatically, depending on the system chosen
- Adding an in-ovo vaccination unit to the system is also an option

Technical Specifications

Capacity	> 36,000 to 50,000 eggs per hour
Candling categories	> Fertile and clear
Type of poultry	> Chicken; Duck
Dimensions (LxWxH)	> 3250 x 1240 x 1900 mm (including transfer unit)
Power consumption	> 3.0 kW
Air requirement	> 5 litre/min at 7 bar
Material	> Stainless steel, equipped with a 5 x 7 cm touch screen full colour display
Includes	> Candling data program > Internet connection via company wi-fi /network
Optional	> Mobility package > In-ovo vaccination preparation
