Egg candling

Hand candling lamp

Benefits

Reliably distinguishes fertile from infertile eggs (clears), as well as revealing hairline cracks, the size and position of the airspace and the size and position of yolk. The developing embryo is clearly visible. This energy saving LED light is ideal for candling small batches of eggs.

How it works

- The candling lamp is manually placed on the egg
- The air cell can be identified and measured to analyze weight loss
- Defective eggs, from small hairline cracks to infertile eggs are easy visible and can be removed from the tray
