Chick box destacker

Benefits

For the safe, stable destacking of chick boxes, the destacker automatically breaks down a stack to supply empty chick boxes ready for re-use, for example to a counting and boxing system. With various layouts and positions possible, the destacker is suitable for use in every hatchery situation. Easy-to-run and operator friendly with very low noise/vibration emissions. Requires zero-to-minimal maintenance for a long life.

How it works

- A stack of empty chick boxes is transported to the destacker
- The stack is automatically loaded into the destacking unit
- The destacker raises the entire stack upwards, leaving the bottom box on the conveyor, which is transported to the transport conveyor system
- The remaining stack is lowered onto the conveyor and the entire stack, without the bottom box, is then raised again
- This sequence is repeated until the entire pile of boxes has been destacked and a new stack is loaded into the system

Individual chick boxes being fed into a chick counting and boxing system by the destacker
